

Semester 2 Module 1

WANs and Routers

Yuda college of business
James Chen
ydjames@ydu.edu.tw

Outline

- WANS
- Routers

Introduction to WANs

- A wide-area network (WAN) is a data communications network spanning a large geographic area such as a state, province, or country.
- A WAN operates at the physical layer and the data link layer of the OSI reference model.

- **Devices in WANs:**
 - **Routers** offer many services, including internetworking and WAN interface ports.
 - **Switches** in the WAN provide connectivity for voice, data, and video communication.
 - **Modems** include interface voice-grade services, channel service units/digital service units (**CSU/DSUs**) that interface T1/E1 services, and Terminal Adapters/Network Termination 1 (TA/NT1s) that interface Integrated Services Digital Network (ISDN) services.
 - Communication servers concentrate dial-in and dial-out user communication.

Router

Workgroup
Switch

Modem or
CSU/DSU

Communication
Server

DTE

Data Terminal Equipment
User device with interface
connecting to the WAN link

DCE

Data-Circuit Terminating Equipment
End of the WAN provider's side of
the communication facility

WAN data link protocols

- HDLC – High-Level Data Link Control
- Frame Relay – Successor of X.25
- PPP – Point-to-Point Protocol
- ISDN – Integrated Service Digital Network (data link signal)

Introduction to routers in a WAN

- A router is a special type of computer.
- It has a CPU, memory, a system bus, and various input/output interfaces.
- However, routers are designed to perform some very specific functions that are not typically performed by desktop computers.

- Just as computers need operating systems to run software applications, routers need the Internetwork Operating System software (**IOS**) to run configuration files.
- These configuration files contain the instructions and parameters that control the flow of traffic in and out of the routers.

- The main internal components of the router are
 - random access memory (RAM),
 - nonvolatile random-access memory (NVRAM),
 - flash memory,
 - read-only memory (ROM), and
 - interfaces.

RAM

- Stores routing tables
- Holds ARP cache
- Holds fast-switching cache
- Performs packet buffering (shared RAM)
- Maintains packet-hold queues
- Provides temporary memory for the configuration file of the router while the router is powered on
- **Loses content** when router is powered down or restarted

NVRAM

- Provides storage for the **startup configuration file**
- Retains content when router is powered down or restarted

Flash memory

- Holds the operating system image (**IOS**)
- Allows software to be updated without removing and replacing chips on the processor
- Retains content when router is powered down or restarted
- Can store **multiple versions of IOS software**
- Is a type of electronically erasable, programmable ROM (EEPROM)

ROM

- Maintains instructions for power-on self test (**POST**) diagnostics
- Stores bootstrap program and basic operating system software
- Requires replacing pluggable chips on the motherboard for software upgrades

Interfaces

- Connect router to network for frame entry and exit
- Can be on the motherboard or on a separate module

Router LANs and WANs

- While a router can be used to segment LANs, its major use is as a **WAN device**.
- They operate at **Layer 3** of the OSI model, making decisions based on **network addresses**.
- The two main functions of a router are the **selection of best path** for and the **switching of frames to the proper interface**.

- A correctly configured internetwork provides the following:
 - Consistent end-to-end addressing
 - Addresses that represent network topologies
 - Best path selection
 - Dynamic or static routing
 - Switching

Router role in a WAN

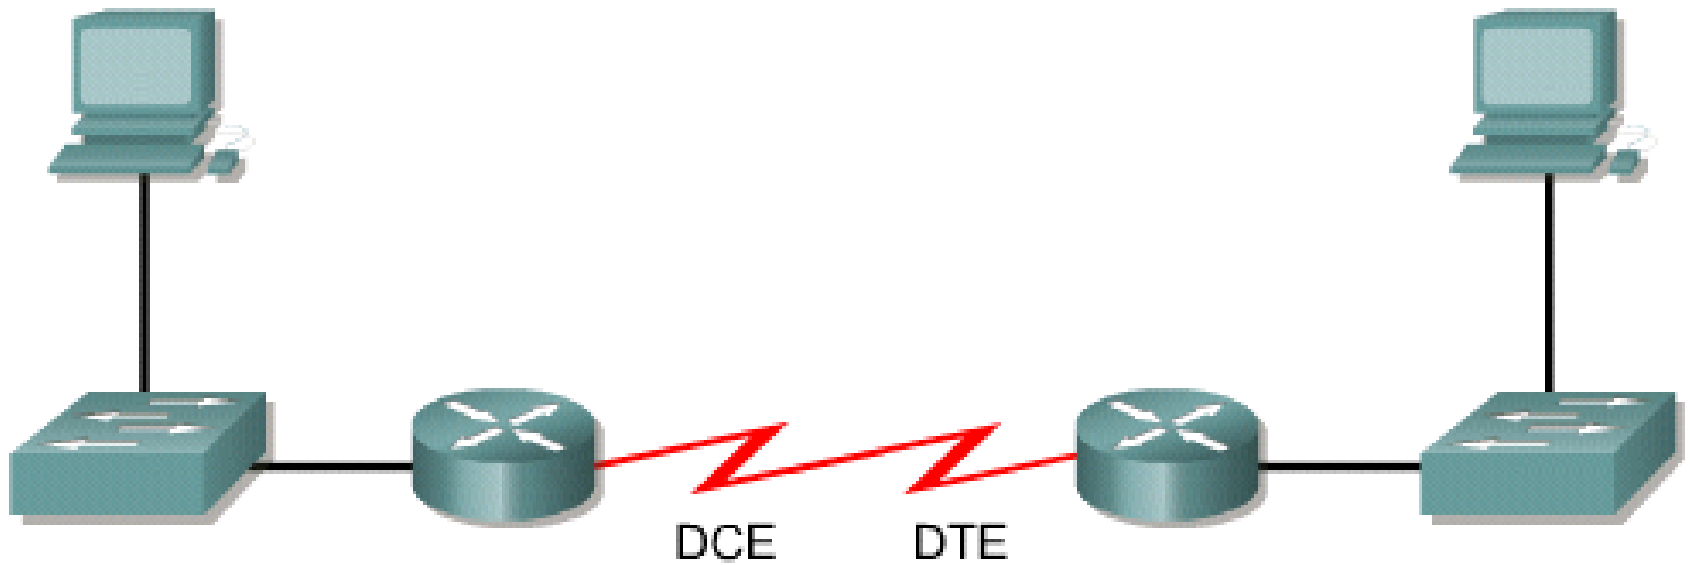

- One of the roles of a router in a WAN is to **route packets at Layer 3**.
- When a router uses **the physical and data link layer standards** and protocols that are associated with WANs, it is **operating as a WAN device**.
- The **primary WAN roles** of a router are therefore not routing, but **providing connections to and between the various WAN physical and data-link standards**.

Academy approach to hands-on labs

- In the academy lab, devices that make up the WAN cloud are simulated by the connection between the back-to-back DTE-DCE cables.
- The connection from one router interface s0/0 to another router interface s0/1 simulates the whole circuit cloud.

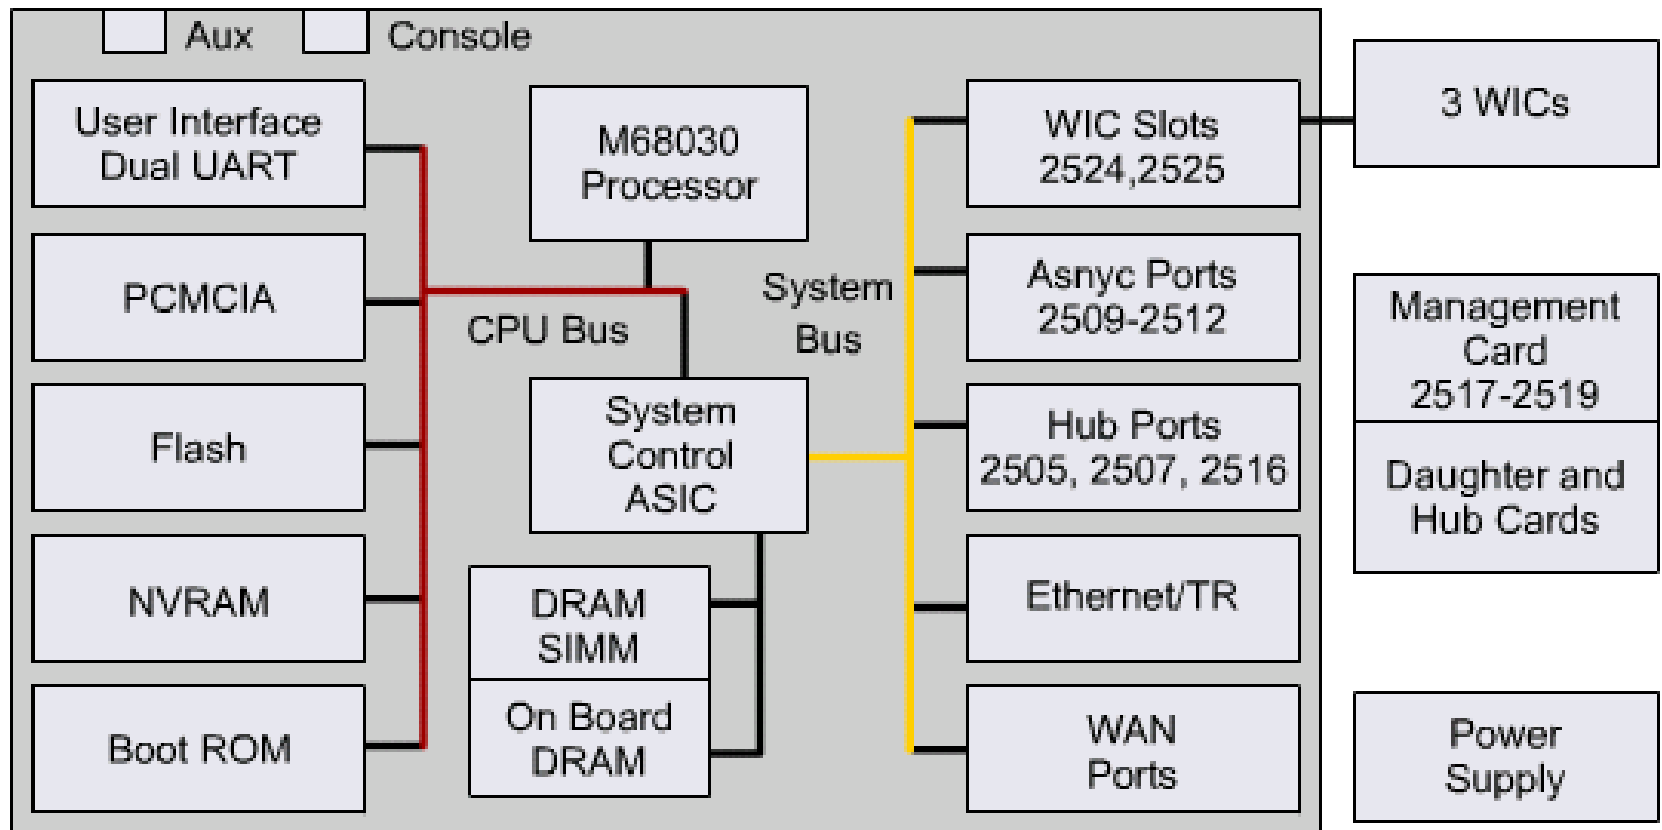

Outline

- **WANs**
- **Routers**

Router physical characteristics

Router external connections

- The three basic types of connections on a router are
 - LAN interfaces,
 - WAN interfaces,
 - management ports.
- LAN interfaces allow the router to connect to the Local Area Network media.

- Wide Area Network connections provide connections through a service provider to a distant site or to the Internet.
- The management port provides a **text-based** connection for the configuration and troubleshooting of the router.
- The common management interfaces are the **console** and **auxiliary ports**.

Management port connections

- When the router is first put into service, there are **no networking parameters configured**.
- To prepare for initial startup and configuration, attach an RS-232 ASCII terminal, or a **computer emulating an ASCII terminal**, to the system console port.
- Then configuration commands can be entered to set up the router.

- The router can also be configured from a **remote location** by dialing to a modem connected to the console or auxiliary port on the router.

Connector

Rollover
Cable

RJ-45 to DB-25
Adapter

Modem

Connecting console interfaces

- The **console port** is a **management port** used to provide **out-of-band** access to the router.
- It is used for the initial configuration of the router, monitoring, and disaster recovery procedures.
- To connect to the console port, a **rollover cable** and a RJ-45 to DB-9 adapter are used to connect a PC.

- The PC or terminal must support **VT100 terminal emulation**.
- Terminal emulation software such as **HyperTerminal** is usually used.

- Configure terminal emulation software on the PC for:
 - The appropriate com port
 - 9600 baud
 - 8 data bits
 - No parity
 - 1 stop bit
 - No flow control
- Connect the RJ-45 connector of the rollover cable to the router console port.
- Connect the other end of the rollover cable to the RJ-45 to DB-9 adapter.
- Attach the female DB-9 adapter to a PC.

COM1 Properties [?] [X]

Port Settings

Bits per second: 9600

Data bits: 8

Parity: None

Stop bits: 1

Flow control: None

OK Cancel Apply

Connection LAN interfaces

- A **straight-through** cable is used to make the connection.
- A 10/100BaseTX router interface requires Category 5 or better, unshielded twisted-pair (UTP) regardless of the router type.

Connecting WAN interfaces

- WAN connection types
 - leased line,
 - circuit-switched,
 - packet-switched
